Test Development Engineer (Power)

Celestica · Richardson, TX

Job ID (this archive)	MFG-057
Employer	Celestica
Location	Richardson, TX
Career stage	New grad / early career
Location group	DFW area
Major (archive tag)	Electrical Engineering
Sector area	Quality, materials & process engineering
Industry (LinkedIn)	Manufacturing
Pay listed	$104,066-$154,778.23
Stated rules	No GPA or sponsorship rule stated
Posted / closes	2026-10-23 · 2026-11-26
Status when checked	Accepting applications on LinkedIn (Nov 1, 2026)
Source page	https://www.linkedin.com/jobs/view/4434111957/
Captured	2026-11-01

Full posting text as it appeared on LinkedIn on Nov 1, 2026, saved for ECS 1100. Postings change and close often; open the source page above for the current version before applying.

At a glance

What you would do

Engineer building automated test setups and Python scripts to validate power electronics, measuring signals with oscilloscopes and debugging issues before manufacturing.

Who can apply

- **Majors named:** No specific major named
- **Degree and experience:** 1-3 years of related experience; power validation, Python/Linux and oscilloscope skills; no degree specified

Skills mentioned

Teamwork & collaboration · Communication · Problem solving & root cause · Automation & controls · Data analysis & statistics · Programming

Full posting text

General OverviewWork with some of the brightest minds in the industry to solve technical challenges with our customers. Our global team of more than 3,000 engineers works across electrical, mechanical, software, design disciplines and many more. Leading brands in enterprise computing, wired and wireless communications, industrial, mechanical, aerospace and consumer markets partner with us to build their products. We help them manage the full product lifecycle – from concept and design through manufacturing, delivery and aftermarket support. Which means you'll have unlimited opportunities to work with new technologies across different industries, and grow your career in any direction you choose

SummaryThe Test Development Engineer (Power) designs, develops and implements automatic test equipment and test programs for product testing and design verification which ensure robust and high quality assembled products in manufacturing. On our growing team, you will be the technical lead for de-risking high-cost product development phases

(EVT and DVT). This is a high-impact, internal-facing role where you will take full ownership of measurement quality for cutting-edge power technologies. You will bridge the gap between design and manufacturing by developing robust test plans and automated logging systems, freeing design engineers to focus on next-generation architecture.

- Detailed DescriptionPerforms tasks such as, but not limited to, the following:Lead the testing and validation of power electronics through EVT/DVT phases, owning the full test plan generation and validation strategy.
- Master the use of oscilloscopes and precision equipment to measure subtle signals and nanovolt-level noise in high-power environments (up to several kilowatts).
- Design and develop integrated test solutions (hardware and software) including high-level architecture, system integration, qualification, and installation.
- Build and maintain automated test scripts using Python and Linux to remotely configure test equipment, microcontrollers, and CPUs.
- Establish a rigorous culture of data organization and indexing for historical test results to enable rapid debugging.
- Manage measurement integrity by identifying if issues stem from design flaws, parasitic interference, grounding loops, or soldering quality.
- Develop technical proposals, cost BOMs, and hour estimates based on customer requirements and design specifications.
- Drive alignment in internal meetings with Program Managers (EPMs) and act as the primary technical contact for power vendors.
- Provide technical leadership and program management for smaller projects, including coordinating and reviewing the work of other engineers.
- Review and interpret customer documentation and conduct research/experiments with minimal direction.
- Execute all validation and qualification requirements using statistical and common industry methods.
- Stabilize and optimize test solutions for manufacturing, focusing on cycle time, yield, and collaboration with process teams.
- Provide feedback to product design teams regarding testability (DFT), coverage, diagnosability, reparability, and firmware/diagnostics.
- Keep up to date with relevant industry knowledge, trends, and regulations.
- Knowledge/Skills/CompetenciesExperience in power validation for semiconductor or high-tech systemFamiliarity with structural and functional testing for high-density power modules.
- A "detective" mindset: An obsession with data organization and the ability to find "needles in haystacks" during urgent debug cycles.experience with Python for test automation and comfort working within a Linux environment.
- Proficiency with Oscilloscopes, LabView, and basic soldering for hardware troubleshooting.
- Physical DemandsDuties of this position are performed in a normal office environment.
- Duties may require extended periods of sitting and sustained visual concentration on a computer monitor or on numbers and other detailed data.
- Repetitive manual movements (e.g., data entry, using a computer mouse, using a calculator, etc.) are frequently required.
- Occasional travel 10-25%

SalaryThe salary range described in this posting is an estimate by the Celestica, and may change based on several factors, including by not limited to a change in the duties covered by the job posting, or the credentials, experience or geographic jurisdiction of the successful candidate. Salary Range: $104,066-$154,778.23

Typical Experience1 to 3 years of related experience
